

Backup and Disaster Recovery

Data backup and restoration is one of the most important aspects of any IT infrastructure. Regrettably, it's often times neglected or preempted by other "immediate" issues. The reality is that the integrity of your organizational data is only as good as your last backup. Ensuring that you can quickly recover from a hardware failure or disaster is what can make the difference between a small interruption in service, and prolonged, costly downtime. Fortunately, backup technologies have become quite affordable and relatively easy to maintain. Atomic Fission has experience deploying commercial applications from Veritas and Computer Associates, as well as deploying fully open source solutions.
